The present sequence represents a fusion protein comprising of TNF alpha fused to the C-terminus of the heavy chain of the human monoclonal antibody 425 (hmbA25). The hmAb425 has specificity for the human EGF receptor. The invention claims for a new pMCLDHAP tricistronic vector (AAV18036) for the expression of an antibody-cycokine fusion protein, hmAb422-TNF alpha. The TNF alpha sequence can be substituted by the IL-2 sequence. The vector alpo contains a strong promoter/enhancer unit, a selection marker gene and at least two policyirus derived internal ribosomal entry site (IRES) sequences. The vector can be expressed in ammanian host cells for the production of heteromeric fusion proteins. This expression system is claimed to produce the heteromeric proteins in high yields
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligo:cietronic expression vector - useful for production of, e.g. MAb425/TNF-~a or MAb425/IL-2 antibody fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Von Hoegen I, Burge C, Bruemmer W, Dunker R, Rieke E,

This polypeptide comprises the heavy chain variable region of the recombinant human monoclonal antibody (MAb) 4BS. 4BS recognises care recombinant human monoclonal antibody (MAb) 4BS. 4BS recognises care antibodies specific for GD2 antigen antibodies specific for GD2 antigen antibodies specific for GD2 antibodies specific for GD2 antibodies specific for GD2 caredoma, colon adenocarcinoma, amall call lump carcinoma, oncon adenocarcinoma and adenocarcinoma. The invention encompasses 4BS derivatives with immunologic specificity for antibodies specific for GD2. These careforms of antibodies specific for GD2. These careforms of the ABS of the AWBS465). Polyucleotide fragments, comprise regions of the 4BS CVD3 innction and regions spanning the 4BS CDRs. Other derivatives include Fab, F(ab) 2, Fab, scrv and isolated heavy and light chains (see also VDJ junction and regions are also provided, and therapeutic plasmids and correcters, including vaccinia virus vectors, comprising these custing vectoria virus vectors, comprising these custing a host immune response to cancer. Products of the invention can be used in the detection and treatment of e.g. astrocytoma, collaponatoralloma, medulobascoma, prinktive neural collaponatoral vectorarcinoma, medulobascoma, prinktive neural collaponatorarcinoma, entitledial adenocarcinoma, small and collaponatorarcinoma, breast tumours such as ductal and lobular adenocarcinoma, breast tumours such as ductal and lobular denocarcinoma, breast tumours such as ductal and lobular adenocarcinoma, breast tumours such as ductal and lobular cut transitional squamous cell carcinoma of the bladder. B and T cell cynthoma malignant melanoma, soft tissue sarcoma and letomorarcinoma and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A humanised CDR-grafted and framework sequence-altered Fd, 5G1.1 VH + 16HRL (AAR7761D), includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1. It can be co-expressed with a humanised light chain (AAR77612) in human 293 EBNA cells using encoding DNAs subcloned into vector APEX-3P (AAT08476). Such humanised recombinant antibodies retain the ability of MAD 5G1.1 to block human complement C5s generation and thus to reduce glomerular inflammation and kidney dysfunction associated with glomerulonephritis. (Updated on 25-MAR-2003 to correct PI field.)

Protein sequences (AAR66295-51) are novel human immunoglobulin heavy chain sequences encoded by novel isolated genes. The genes (AAQ78339-7902) ware isolated and cloned from a series of cosmid constructs: V202; V103; V21; Y6; V24; 3-31; M84; M18 and M31; by PCR amplification using primers AAQ78917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placenta. The DNA was separated by gel elecrophoresis and 35-45 kb fractions were collected. The fragments were ligated with TaqI restriction enzyme. The fragments were injugation products were in vitro packed and infected into E. coli 490A. The fragments were hon subcloned by colony Mybridisation. The Vh genes and the DNA fragments encoding them are useful in producing human immunoglobulin in mammallan hosts. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 MDWIWRILFLVAAATGTHAQVQLVQSGAEVKKPGASVKVSCKVSGYTLTELPVHWVGQAP

The invention discloses a recombinant antibody comprising a constant region of monoclonal antibody (Mab) 57 linked to a non-Mab 57 variable region. Rabies is an acute, neurological disease caused by infection of the central nervous system with the rabies virus, a member of the Lyssavirus genus of the family Rhabdoviridae. Also disclosed are methods for producing an isolated recombinant antibody by culturing a host cell, containing a recombinant entibody by culturing a host cell, molecule encoding the antibody. And isolating the nucleic acid molecule encoding the antibody versesed and treating an individual exposed to a pathogen by expressed and treating an individual exposed to a pathogen by antibodies are useful for preventing (vaccine) and treating an individual exposed to a pathogen, e.g. rabies infection. They are also useful for the qualitative and quantitative determination of the rabies virus. The sequences presented are the antibody protein fragments, the nucleic acids encoding them or the PCR primers used to construct the recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant antibody comprising a constant region of Mab 57 linked to a non-Mab 57 variable region, useful for treating an individual exposed to a pathogen, e.g. rabies infection.

Sequence 10, Application US/1039086
Publication No. US20030166011A1
GENERAL INFORMATION:
APPLICANT: Japan Tobacco, Inc.
TITLE OF INVENTION: Monoclonal Antibody Against Connective Tissue Growth Factor
TITLE OF INVENTION: and Medicinal Uses Thereof
FILE REFERENCE: J1-009PCT
CURRENT APPLICATION NUMBER: US/10/390,986
CURRENT FILING DATE: 2003-03-17
PRIOR PILING DATE: 2003-03-17
PRIOR APPLICATION NUMBER: JP P1997-367699
PRIOR APPLICATION NUMBER: JP P1997-367699
PRIOR APPLICATION NUMBER: JP P1998-356183

This sequence represents the light chain variable region of the human monoclonal antibody (MAb), BO2C11. BO2C11 is a human MAb which recognises a conformational epitope within the carboxy-terminal of the factor VIII light chain. BO2C11 recognises both the wild type and Arg1s0fils factor VIII light chains. The MAb produced by the cell line of the invention, KRIXI, specifically recognises the wild type factor VIII light chains. The MAb produced by the cell line of the invention, KRIXI, can be used to inhibit the brinding of factor VIII light chain. Second to inhibit the brinding of factor VIII light chain. The mew cell line KRIXI, is deposited with the Belgian Coordinated Collections of Micro-organisms, under accession number LMBP 5089CB. KRIXI, or fragments of it, optionally with a thrombolytic agent, are useful for the treatment and/or prevention of hemostasis, coagulation disorder thrombolic pathologic condition such as intravascular coagulation, arterial thrombosis, arterial restensis, venous thrombosis or arteriosclerosis, and attenuation of coagulation in ammmal. An effective and safe antithrombotic therapy is provided which reduces the risk of bleeding in mammals, more particularly in humans
                                                                                                                                                                                                                                                                   ò

The present invention relates to a pharmaceutical composition for the prevention and/or treatment of systemic Inflammatory response syndrome (SIRS), espsis, septic shock, thrombus formation in the microvasculature and disseminated intravascular coagulation in mammals, comprising as an active ingredient a partial inhibitor of factor VIII, in admixture with a cartive intractions may include the antibodies B02011 and KRIXI. The present sequence is the light chain variable region of B02011
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PGOAPRLLIYGASTRATGIPDRFSGSGSGTDFTLTISRLEPEDFAVYYCOKYGTSAITFG 120
